

CS 692 Systems Capstone Exam, Spring 2024

Please read the following instructions before you start the exam. Please avoid asking a question that is addressed below:

- 1) You can write your answers on both sides of the paper. If you run out of space as you answer the questions on the front pages, continue your answer on the back of the page. Please do not ask the instructor whether you can write on the back side of the paper. The answer is YES YOU CAN.
- 2) You may use the last paper sheet (front and back) as scratch paper. It is also marked

Full name: _____ Net ID: _____

Question 1) Scheduling

Using the table below, show how the processes would be scheduled using the CPU scheduling algorithms listed below the table. Please show your work with a **Gantt chart** for **a, b, and c**.

	Arrival (secs)	Burst	Priority
P1	0	7	2
P2	3	3	3
P3	5	2	1
P4	7	5	3
P5	9	2	2

- (5pts) **Round Robin** with time quantum of **2** seconds
- (5pts) **Pre-emptive Shortest job first**
- (5pts) **Pre-emptive priority** if there are any ties, the lower numbered process goes first.
- (3pts) List one **disadvantage** of the **Pre-emptive Shortest Job First** scheduling algorithm.
- (2pts) Please write the **formula** for **process wait time**.

Question 2 Dining Philosophers - shared resources

2. a) (5pts) Assume that process synchronization is NOT enabled. Given that the current value of **total = 2**, what are the four (4) possible values of **total** after the **X** and **Y** processes execute? Explain under which conditions these values can occur. The X and Y processes are below:

Process X: total = total + 2;

Process Y: total = total * 3;

b) (5pts) In terms of the critical section problem and multiple processes, what is meant by the **bounded waiting** and

c) (5pts) Consider the **incorrect** solution to the Dining Philosophers problem below where philosophers are either thinking or eating. There are five (5) philosophers i where $i = 0, 1, 2, 3, 4$. There are five (5) semaphores $\text{fork}(i)$ which are initialized to 1. Show a sequence of events where **deadlock** can occur.

```
while(true){
    think;
    wait(mutex);
    wait(fork[i];
    signal(mutex);
    wait(mutex);
    wait fork[i + 1) % 5];
    signal(mutex);
    eat;
    signal(fork[i]);
    signal(fork[(i + 1) % 5];
}
```

d) (5pts) Show how you would you fix the code above so that it is correct.
