analysis herein, because they are based on either completely sequenced genomes or random sequencing projects.
24. D. Grant, P. Cregan, R. C. Showemaker, *Proc. Natl. Acad. Sci. U.S.A.* **97**, 4168 (2000).
25. This estimate is the average of two surveys based on analyses of multiple genes in vascular plants (*7, 42*).

30. In large genomic databases like those analyzed here, some sequencing errors may inflate the apparent level of divergence, but this error should be independent of *S*, and in any event, is unlikely to add more than 0.01 to individual estimates of *S*. Thus, the impact of such error on our statistical analyses should be negligible.
31. This estimate is the average of the results obtained in three broadly compatible studies, all of which surveyed a large number of genes [S. Easteal, C. Collet, *Mol. Biol. Evol.* **11**, 643 (1994); T. Ohta, *J. Mol. Evol.* **40**, 56 (1995); (*7*)].
